

Kelp Meal 1-0-2

Kelp Meal is an organic fertilizer with a high potassium ratio (1-0-2) making it perfectly suited for growing indoor plants, flowers, lawns or vegetable gardens. Excess potassium is dissolved and used by the plants to create greater color and size in fruit and flowering plants. Potassium also helps plants fight disease as well.

Kelp alone contains over 70 vitamins and minerals beneficial to plants and you never have to worry about creating a toxic environment for plants or animals. Additionally, plants that receive a slow steady application of nutrients during the growing period are healthier and have an increased tolerance to both pests and disease.

Kelp is completely natural and keeps on working to condition the soil even after nutrients are absorbed by growing vegetation. Additionally, kelp increases the structure of the soil and its ability to retain moisture. Its benefits go beyond your current, active gardening season; kelp is continually improving the soil for next year's garden as well.

Kelp meal can be used by sprinkling directly around plants, onto the garden or by adding water to it, straining and using it in a liquid form. The best thing is you don't have to worry about chemicals or the ill-effects of adding too much to your garden.
